                                          An endoplasmic reticulum stress transcription factor (bZIP) and ccapable of regulating transcription inducing activity exhibited by an CC capable of regulating transcription inducing activity exhibited by an CC clement (ERSE) can be used in a method for controlling expression of CC an endoplasmic reticulum chaperone. The method comprises expressing CC bZIP. The method can be used for expression of a foreign protein by CC controlling regulating expression of an endoplasmic reticulum consperone either positively or negatively in CC centrolling and therefore is useful for treatment or prophylaxis of centrols and therefore is useful for treatment or prophylaxis of centrols and therefore is useful for treatment or prophylaxis of the endoplasmic reticulum chaperone and thereby increases the capacity of a foreign protein. This sequence taken from the capacity of a foreign protein (GRP) promoter GRP78 contains an ERSE like Compression of a foreign protein (GRP) promoter GRP78 contains an ERSE like

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       12-NOV-1999;
                                                                                                                                                                                                                                                                                                                   An endoplasmic reticulum stress transcription factor (b2IP) an capable of regulating transcription inducing activity exhibited by an capable of regulating transcription inducing activity exhibited by an endoplasmic reticulum chaperone. The method comprises expressing an endoplasmic reticulum chaperone. The method comprises expressing b2IP. The method can be used for expression of a foreign protein by b2IP. The method can be used for expression of an endoplasmic reticulum positively regulating expression of an endoplasmic reticulum chaperone gene. b2IP is useful for controlling the expression of chaperone gene. b2IP is useful for controlling the expression of
                                                                                                                                                                                           endoplasmic reticulum chaperone either positively or negatively in cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the expression of a foreign protein (GRP) promoter GRP78 contains an ERSE lightcose regulating protein (GRP) promoter GRP78 contains an ERSE lightcose regulating protein (GRP) promoter GRP78 contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 1; Fig 3; 157pp; English.

The method comprises expressing an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by bZIP. The method can be used for expression of a foreign protein by chaperone gene. bZIP is useful for controlling the expression of chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in endoplasmic reticulum chaperone either positively or negatively in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (HSPR-) HSP RES INST INC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An endoplasmic reticulum stress transcription factor (bZIP)
C capable of regulating transcription inducing activity exhibited by an 2C element (ERES) can be used in a method for controlling expression of 2C an endoplasmic reticulum chaperone. The method comprises expressing 2C chaperone gene. bzIP is useful for expression of a foreign protein by 2C chaperone gene. bzIP is useful for controlling the expression of cendoplasmic reticulum chaperone either positively or negatively in 2C cells and therefore is useful for treatment or prophylaxis of 2C cencers, arteriosclerosis, cystic fibrosis, ischaemic diseases, 2C the endoplasmic reticulum chaperone and thereby increases the 2C cancers arteriosclerosis, cystic fibrosis, ischaemic diseases, 2C the endoplasmic reticulum chaperone and thereby increases the 2C cancers and ulcers bzIP also maintains the correct conformation of 2C cancers and thereby increases the 2C cancers are all the correct conformation of 3C cancers and 12 feeting protein. This sequence taken from the 2C cancers and 12 feeting protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         capable of regulating transcription inducing activity exhibited by a element (ERSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing positively regulating expression of a foreign protein by chaperone gene bair is useful for controlling the expression of an endoplasmic reticulum endoplasmic reticulum chaperone either positively or negatively in cancers, arterioscalexosis, cystic fibrosis, ischaemic diseases, the endoplasmic reticulum chaperone and therefore is useful for treatment or prophylaxis of wounds and ulcers bzip also maintains the correct conformation of a foreign protein. This sequence taken from the expression of a foreign protein. This sequence taken from the

The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in
                                                                                                                                                                                                                                                                      Endoplasmic reticulum; stress; ER; transcription factor; transcription; regulatory element; ERSE; bZIP; chaperone; treatm prophylaxis; cancer; arteriosclerosis; ischaemia; wound healing; cystic fibrosis; ulcer; gene therapy; recombinant gene; mouse;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the calreticulin (CRT) promoter contains an ERSE like sequence.

The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone, gene. bZIP is useful for controlling the expression of
                                           New endoplasmic reticulum stress transcription factor (known as bZIP) for controlling expression of endoplasmic reticulum chaperone, useful for treating cancers, arteriosclerosis, cystic fibrosis, ischemic
                                                                                                                                                                                                                                                                                                                                                                                                                               Endoplasmic reticulum, stress; ER; transcription factor; transcription; regulatory element; ERSE; bZIP; chaperone; treatment; prophylaxis; cancer; arteriosclerosis; ischaemia; wound healing; cystic fibrosis; ulcer; gene therapy; recombinant gene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         endoplasmic reticulum chaperone either positively or negatively cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, renamic diseases, wounds and ulcers. bZIP also maintains the correct conformation the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein. This sequence taken from the
                                diseases, wounds and ulcers
                                                                                                                                                                                                                         09-JUN-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                 The present invention relates to a method for screening a substance for controlling ORP150 expression. The method comprises examining the expression of a reporter gene product in the presence of a cell strain transformed by a vector. In the vector, the reporter gene is connected downstream of the promotor region of ORP150 gene and a sample to be tested. The method can be used to obtain drug compositions which alter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             An endoplasmic reticulum stress transcription factor (bZIP) capable of regulating transcription inducing activity exhibited by an element (BRSE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by
                                                                      ORP150 expression. The drug composition can be used for the treatment of various diseases e.g. ischaemic diseases, wounds, ulcers, diabetes, neurodegenerative diseases, cancers or autoimmune diseases. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cells and therefore is useful for treatment or prophylaxis of cancers, arteriosclerosis, cystic fibrosis, ischaemic diseases, wounds and ulcers. bZIP also maintains the correct conformation of the endoplasmic reticulum chaperone and thereby increases the expression of a foreign protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum chaperone gene. bZIP is useful for controlling the expression of endoplasmic reticulum chaperone either positively or negatively in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ORP150; drug; ischaemic disease; wound; ulcer; diabetes; ERSE; neurodegenerative disease; cancer; autoimmune disease; promoter; ds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ₽
       express the heterologous gene in a biologically stressed environment. The current invention thus relates to a nucleic acid construct comprising at least two copies of an endoplasmic reticulum stress element (ERSE). The preferred ERSE of the invention is the sequence shown here which corresponds to a glucose responsive protein (grp) 78 gene promoter ERSE.
                                                                                         Targeted gene expression is tool used for gene therapy of diseases and is based on 2 main strategies: (1) targeted entry of a heterologous nucleic acid to a host cell; and (2) specific tissue or cell expression of the heterologous gene. In general, heterologous gene expression has general purpose Murine Leukaemia Virus (MuLV) Long Terminal Repeat (LTR) promoter sequence. Promoters such as these sometimes fail to adequately
  The construct also comprises a heterologous nucleic acid
                                                                                                                                                                                                                                                 A nucleic acid construct comprises a stress-responsive non-coding regulatory sequence useful in treating and detecting cell proliferative disorders, e.g. cancer, or biological stress resulting from glucose
                                                                                                                                                                                                                   Claim 1; Page 83; 121pp; English.

ACCCCCCXXX PXX PT PT PT XX PXX PXX PT XX P

capable of regulating transcription inducing activity exhibited by an element (ERRE) can be used in a method for controlling expression of an endoplasmic reticulum chaperone. The method comprises expressing bZIP. The method can be used for expression of a foreign protein by positively regulating expression of an endoplasmic reticulum

An endoplasmic reticulum stress transcription factor (bZIP)

The invention possibly associated with inflammation, for example neoplastic disorders such as lung cancer, colon-rectum cancer, breast cancer, prostate cancer, uranary tract cancer, uterine cancer lymphoma, oral cancer, pancreatic brain cancer and ovarian cancer. The invention is also useful for cancer, colon-human transgenic animals of the invention is also useful for cancer.

Non-human transgenic animals of the invention include vertebrates such as condenses and contents and con

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABQ00200;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO200216649-A2.
                                                                                                            The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in AB000010-AB013409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (AB000010-AB013409) to a target nucleic acid to form a modified target (AB000010-AB013409) to a target nucleic acid to form a modified with (I). nucleic acid and contacting the modified target nucleic acid with (I) the steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target which further comprises detecting the presence of the modified target
                                                                                                                                                                                                                                                                                                                    Array comprising adapter sequences useful for immobilizing or detecting a target nucleic acid sequence, has different addresses comprising different specific capture probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           25-AUG-2000; 2000US-227948P-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic
                                                                                                                                                                                                                                                                                                                            25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid nucleic acid adapter nucleic acid with (I). nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid, which further comprises detecting the presence of the modified target which further comprises detecting the presence of the modified target

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). which further comprises detecting the presence of the modified target nucleic acid, which further comprises detecting the presence of the modified target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 24 BP; 6 A; 9 C; 5 G; 4 T; 0 other;

(I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid and contacting the modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25 different addresses (adapter sequences) with each comprising a different capture probe selected from a group consisting of the sequences given in ABQ00010-ABQ13409. (I) is useful for immobilising a target (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). which further comprises detecting the presence of the modified target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 24 BP; 4 A; 5 C; 9 G; 6 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WO9844130-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Helicobacter pylori
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic
                                                                                                                                                pcR primers (see AAV45529 and AAV45530) are designed for the PCR amplification of the Helicobacter pylori ureg gene. The invention relates to recombinant DNA (see AAV62460-61) comprising a fusion gen prepared by ligating an antigenic determinant coding gene (e.g. the prepared by ligating an antigenic determinant coding gene (b.g. the prepared by ligating and A2 and B subunit genes of Vibrio cholerae. Also claimed are chimeric proteins (see AAW80599-600) cholerae. Also claimed are chimeric proteins (see AAW80599-600) cholerae. Also claimed are chimeric proteins in preventative and therapeutic vaccines for H. pylori-proteins in preventative and therapeutic vaccines for H. pylori-proteins in preventative and therapeutic vaccines for H. pylori-proteins in diseases such as gastritis, gastric ulcer, duodenal associated diseases such as gastritis, gastric ulcer, duodenal
                                                                                                                                                                                                                                                                                                                                               New chimeric proteins for use against Helicobacter pylori comprising an antigenic protein of H. pylori and Al and B subunits of Vibrio cholerae toxin, preferably produced by recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                     Choi D,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO200216649-A2
                                                                                                                                                                                             The invention relates to an oligonucleotide array (I) comprising at least 25 different addresses (adapter sequences) with each comprising a 25 different capture probe selected from a group consisting of the sequences different capture probe selected from a group consisting a target given in ABQ00010-ABQ13409. (I) is useful for immobilising a target nucleic acid sequence by attaching a adapter nucleic acid modified target (ABQ00010-ABQ13409) to a target nucleic acid to form a modified target nucleic acid and contacting the modified target nucleic acid with (I). The steps of above method is useful for detecting a target nucleic acid. The steps of above method is useful for detecting a target nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     27-AUG-2001; 2001WO-US26519
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  28-FEB-2002

Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     larvae were collected from 14 day fecal-sphagnum moss cultures of Ostertagia eggs. The larvae were recovered by overnight passage on a Baermann apparatus, and then cleaned by passage through a 20 micron nylon mesh. The larvae were then subjected to a treatment with 1.25% chlorox to induce excystation. The larvae were washed with 5 changes of PBS and then pelleted and snap frozen in liquid nitrogen."

St. Louis. The cDNA was made by using Dynabead oligo-dT priming (Dynal). PGR based library using a modified protocol from the SMART PCR cDNA Synthesis kit from Clontech. Directionally cloned into the UDC sites of pAMPI. Nematodes were provided by Dr. Louis Gasbarree of the USDA, Beltsville, MD (1998 barreani.barc.usda.gov). Third stage exsheathed the control of the USDA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               13 a
                                                                                                                                    note="organ: leaf; Vector: RescueMu (engineered from pBlueScript backbone); Site_1: BamHI; Site_2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and BgIII, and ligated to form circular plasmids DH10B
                                                                                                     cells were transformed and then screened on LB plates with ampicillin."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH1OB cells were transformed and then screened on LB plates with ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                      / vector: pGEM-TA-Easy: A Cot analysis was performed / note="Wector: pGEM-TA-Easy: A Cot analysis was performed for the sorghum genome. Based on the resulting Cot curve, for the sorghum genome. Based on the resulting Cot curve, whighly-repetitive (HR), / moderately-repetitive (MR), / highly-repetitive (HR), / moderately-repetitive (MR), / highly-repetitive (DNA). The three repetition-based DNA sheared genomic DNA. The three repetition-based DNA sheared genomic DNA. The three repetition-based DNA components were cloned into E. coli to produce HRCOt, components were cloned into E. coli to produce HRCOt, and SLCOt genomic libraries. Blotting and MRCOt, and SLCOt genomic libraries. Blotting and sequencing data indicates that each library is sequencing data indicates that each library is representative of the component from which it was derived. Putative ID listings given for sequences are based on putative ID listings given for sequences in the NCBI NT comparison (blastn) with sequences in the NCBI NT Database. Only the primary match is given (all primary E values are < or = 1.00E-5). In no instance does a 'Cot clone' contain the complete sequence of its putative Nr match."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  706-583-0167

/note=Torgan: pooled: Vector: pTTT3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not 1; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized NCI-CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 297480-302087, 682632-687239,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note="Organ: leaf; vector: RescueMu (engineered from /note="Organ: leaf; vector: RescueMu; Site_2: BglII; pBlueScript backbone); Site_1: BamHI; Site_2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHII and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with

Complementary DAN was synthesized from mRNA using a primer consisting of a poly (dT) sequence with a XhoI restriction site. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI XhoI restriction site of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note="Vector: pBluescript II XR; Site_1: EcoRI; Site_2: XhoI; This cDNA library was constructed from mRNA isolated from 2-3 week old greenhouse grown plants.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           23
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             library (UIR-C3) was constructed as follows: PCRamplified cDNA inserts from UIR-C2p clones from which 3' ESTs had been derived was used as a driver in a hybridization with the UIR-C2p library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the UIR-C3 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6:91-806, 1996)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         319 335 9565
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note=/vector: pyTyB3-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C3 library is a subtracted library of a series, ultimately derived from a mixture of individually tagged normalized libraries from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, muscle, and 8, 12 and 18-day embryos, after a series of subtractions to reduce the representation of cDNAs from which ESTs had already been generated. The following serially subtracted libraries were generated in this process; UI-R-C3, UI-R-C2p, UI-R-C1, UI-R-C1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /strain="Sprague-Dawley"

RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid G was grown at Stanford in 2000. DNA was
extracted from leaf punches, double digested using BamHI
and BgIII, and ligated to form circular plasmids. DH10B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cells were transformed and then screened on LB plates with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /note-*organ: leaf; vector: RescueMu (engineered from pBlueScript backbone); Site_1: BamHI; Site_2: BgIII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from laef punches, double digested using BamHI and BgIII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid K was grown at Molokai, Hawaii in Minter 2000-2001. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with ampicillin."
